

## Automate data entry of Explanation of Benefits (EOB) forms

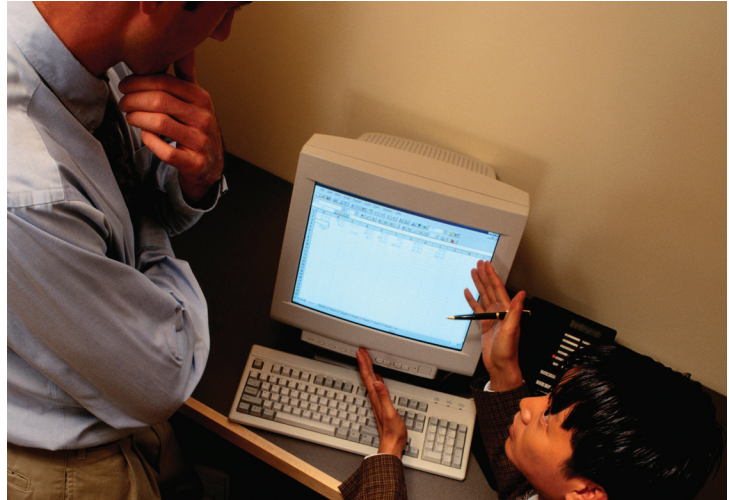

**AnyDoc® EOB automates EOB processing to increase accuracy and cash flow while virtually eliminating slow, error-prone manual data entry.**

AnyDocEOB dramatically improves processing of paper EOB forms. AnyDoc Software has renowned expertise in handling complex form types, and AnyDocEOB is designed to help you process details, speed payment processing and expedite re-submittals while capitalizing on secondary billing opportunities.

Many companies cannot afford the cost of entering the large amount of details on their EOBs. Some forfeit secondary billing or re-submit large denials, even though small denials add up to a large sum over the course of a year.

An EOB page can be scanned in seconds, taking data from paper to digital much quicker, in greater detail and more accurately than a human operator. AnyDocEOB handles the data-rich, small type and difficult to read EOB forms with unparalleled data accuracy.

Automated balancing identifies and crosschecks sub- and grand totals to the individual claim and the accompanying check. You can also store not only the full EOB image, but also individual patient claims to assist in meeting federal HIPAA compliance.

**Experience the benefits of AnyDocEOB in your organization.**

### **Reduce manual data entry cost**

EOBs are one of the most time-intensive documents to manually key into your system. With automated EOB processing, every data field can be extracted and validated in seconds. You will accomplish more processing with fewer operator hours. And exceptions are still routed to supervisors, ensuring human intervention for accuracy when necessary.

### **Improve data accuracy**

AnyDocEOB utilizes automated image clean up, built-in and custom rules, table lookups and verifier interaction to capture EOB data. The automated verification process helps ensure that complete and balanced remittance advice transactions are delivered into your accounts receivable system.

### **Increase efficiency with automatic balancing**

A balancing feature cross-checks data fields to verify detail procedure, patient claim and EOB totals. The EOB total is balanced to the check received and a balanced EOB can optionally bypass verification, reducing processing and cash flow cycle time.

## KEY FEATURES

### Unique EOB verification screen

During processing, the current patient record is completely highlighted on the image, assuring that the verifier never confuses one patient with another, especially when moving from page to page.

### Automatic document set creation

Multiple EOBs can be scanned in the same batch and automatically identified as different documents, without manual page insertion.

### Batch balancing

Single EOBs, scanned as unique batches, or multiple EOBs scanned as one batch can be automatically balanced to a single check amount.

### Wizard

AnyDocEOB will further impress you with one of the fastest implementation cycles in the industry. Powerful EOB processing options are already built into the core software, so custom scripting is not required—unlike other competitive solutions. AnyDoc Software offers industry-leading AnyApp technology to assist you, complete with an easy-to-use wizard to jump-start your EOB processing on the way to a rapid ROI.

### Snippets aid in HIPAA compliance

Snippets are individual image files created from an EOB for each patient claim. When snippets are used in a document management system, an operator can retrieve an image of any specific patient

claim without having to page through other patient's records, greatly assisting you with HIPAA compliance.

### Out-of-balance notification

During verification, out-of-balance subtotals and total figures are brought to the attention of an operator for quick corrective action. These mathematical calculations can be placed on row or columnar items for quicker transition of correct data into backend systems.

### EDI output

HIPAA-standard EDI 835 transaction sets are available as output from our complementary product, EXCHANGEit. Purchased separately, EXCHANGEit provides healthcare-standard EDI 835 and 837 output.

### Time saving enhanced workflow

Snippet files contain only a single patient claim, making any additional workflow dealing with the patient claim (denials, patient questions, re-submittals, etc.) extremely efficient. The individual patient snippet can be faxed, printed, viewed or copied into a document in seconds. No need to spend hours blacking out other patient claims on the same EOB page before transmitting.

### Dynamic line item adjustment

Individual patient records on the EOB will vary in the number of procedure-items being reported for each patient. AnyDocEOB dynamically adjusts during the verification process to match this item count and only displays fields associated with data.
